MEMORANDUM

TO: Council Members

FROM: Leann Bleakney, Oregon State Staff

SUBJECT: Presentation by Portland General Electric on their IRP and Grid Modernization Planning, including Demand Response

BACKGROUND:

Presenters: Jason Salmi Klotz, manager, regulator and policy strategy, grid architecture, integration and system operations
Shauna Jensen, IRP analyst
Andy Macklin, director of grid products and integration

Summary: For more than 125 years, Portland General Electric has delivered electricity to a large portion of Oregon's population. PGE's territory includes most of the Portland metro area, Willamette Valley and beyond. More than 1.9 million people receive electricity from PGE. More than 50 cities are served by the utility with a territory that includes more than 4,000 square miles.

Late last month PGE released its Integrated Resource Plan. The Oregon Public Utility Commission requires the state's investor-owned utilities to submit plans for meeting its electricity demand. IRPs are conducted every other year. On July 19, 2019, Portland General Electric filed a 2019 integrated resource plan with the Oregon Public Utility Commission. PGE's 2019 IRP Action Plan includes an array of actions in the next two to four years to meet pending resource needs. The proposed actions fall

into the following categories: customer resource actions, renewable actions and capacity actions.

Specifically, the IRP calls for:

- 150 average megawatts of additional renewable resources by 2023.
- A similar amount (157 average megawatts) of additional cost-effective energy efficiency measures.
- Increased reliance on demand response to help balance sources and uses of electricity during peak months. This includes 141 megawatts during winter months, 211 megawatts during summer months, and 4 megawatts of customer battery storage.
- Additional actions to help meet capacity needs resulting from expiring contracts and the retirement of baseload coal plants like PGE's Boardman Generating Station.

Shauna Jensen, IRP analyst, will talk with the Council about this recently released IRP, the need for resources the company identified and its plan for meeting that resource need.

Jason Salmi Klotz, manager of regulatory and policy strategy, grid architecture, integration and system operations; and Andy Macklin, director of grid products and integration, will introduce the Council to the work PGE is doing to modernize the utility's grid and operations.

PGE is moving to rapidly adopt strategies to meet changing customer demand, resource availability and respond to changes in public policy.

For example, between now and 2030, the utility estimates that to meet customer demands for renewable energy, it will need about 2.5 times the wind and solar resources it has in its current portfolio. In addition, PGE estimates it will require a 10-fold increase in energy storage capabilities, a 20-fold increase in electric vehicle charging on the grid and a 10-fold increase in demand response programs.

Portland General Electric proposes clean energy, smart grid resource plan

Strategy calls for more renewable generating resources, more energy efficiency, and increased customer demand-response measures to help balance peak loads

PORTLAND, Ore., July 22, 2019 / -- Portland General Electric Company (NYSE: [POR](#)) has presented a new [integrated resource plan](#) to the Oregon Public Utility Commission for approval. This new plan focuses on adding more renewable power, capturing more energy efficiency, and strengthening partnerships with customers to help balance energy supply and demand during periods of peak energy use.

"This is the first resource plan developed since we expanded our commitment to cut PGE greenhouse gas emissions," said Maria Pope, PGE's president and CEO. "It proposes measured steps we can take today to address climate change, while allowing flexibility for adjustments as technology and policies continue to evolve."

Developed through a multi-year research and engagement process that included constructing and testing 43 different portfolios to identify resource actions needed between now and 2025, the plan calls for:

- 150 average megawatts of additional renewable resources by 2023.
- A similar amount (157 average megawatts) of additional cost-effective energy efficiency measures.
- Increased reliance on demand response to help balance sources and uses of electricity during peak months. This includes 141 megawatts during winter months, 211 megawatts during summer months, and 4 megawatts of customer battery storage.
- Additional actions to help meet capacity needs resulting from expiring contracts and the retirement of baseload coal plants like PGE's Boardman Generating Station.

PGE filed the plan with the OPUC July 19, kicking off a public review process before commissioners decide whether the utility has identified an appropriate least-cost, least-risk plan to reliably serve customers, consistent with applicable state and federal energy policies. Under the plan, PGE will seek to meet customers' energy needs without

building greenhouse gas-emitting resources, even as the company prepares to cease coal-fired operations at Boardman at the end of 2020.

Customer and stakeholder insights and feedback were instrumental in shaping the company's approach, which was also guided by PGE's [Vision for a Clean Energy Future](#). The company introduced its vision as a white paper in 2018 to help lay out a course for accelerating Oregon's clean energy transformation. Recent initiatives in support of this effort include:

- The announcement earlier this year that PGE will partner in developing the new [Wheatridge Renewable Energy Facility](#) in eastern Oregon, the first generating plant of its scale to combine wind and solar energy with battery storage.
- Advancement of electrification in other portions of the economy, especially through [electric cars, transit buses and other vehicles](#) in the transportation system, which currently account for 40% of Oregon GHG emissions.
- Enhanced reliability through [system modernization](#) to create a smarter, more resilient, more flexible grid.
- Elimination of coal-fired generation from PGE's resource mix no later than 2035 to help [decarbonize our energy system](#), starting with decommissioning of the Boardman facility.

The energy industry is undergoing a period of profound change and uncertainty driven by climate change, new technologies and changing customer expectations. By incorporating maximum flexibility into the plan, PGE will be able to accommodate shifts in needs in consultation with the OPUC and stakeholders.

Action on the resource plan by the commission – the formal regulatory term is called "acknowledgement" – is expected by the first quarter of 2020. If the OPUC acknowledges the plan, PGE will then conduct a request for proposals for new renewable resources, implement the necessary energy efficiency actions and demand response programs, and seek opportunities for bilateral negotiations with existing generators in the region to meet resource capacity needs. If enough capacity cannot be acquired through bilateral negotiations, the company will consult with the OPUC and potentially conduct a second RFP, which would be limited to non-emitting energy resources.

About Portland General Electric Company: Portland General Electric (NYSE: [POR](#)) is a fully integrated energy company based in Portland, Oregon, serving approximately 887,000 customers in 51 cities. For 130 years, PGE has been delivering safe, affordable and reliable energy to Oregonians. Together with its customers, PGE has the No. 1 voluntary renewable energy program in the U.S. With approximately 2,900 employees across the state, PGE is committed to helping its customers and the

communities it serves build a clean energy future. For more information, visit PortlandGeneral.com/CleanVision.

Safe Harbor Statement: Statements in this news release that relate to future plans, objectives, expectations, performance, events and the like may constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995, Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended. Forward-looking statements include statements regarding the company's future energy mix; statements concerning the company's integration of smart-grid technologies and renewable energy into the grid; statements regarding construction and operation of generating and battery storage facilities; as well as other statements containing words such as "anticipates," "believes," "intends," "estimates," "promises," "expects," "should," "conditioned upon," "will," "would," "could" and similar expressions. Investors are cautioned that any such forward-looking statements are subject to risks and uncertainties, including construction and operational risks relating to the generation and battery storage facilities, including resource availability and unscheduled delays or plant outages, which may result in unanticipated operating, maintenance and repair costs, as well as replacement power costs; the costs of compliance with environmental laws and regulations, including changes in weather, hydroelectric and energy markets conditions, which could affect the availability and cost of purchased power and fuel; changes in capital market conditions, which could affect the availability and cost of capital and result in delay or cancellation of capital projects; failure to complete capital projects on schedule or within budget, failure of the counterparty to perform under the agreements, or the abandonment of capital projects, which could result in the company's inability to recover project costs; the outcome of various legal and regulatory proceedings; and general economic and financial market conditions. As a result, actual results may differ materially from those projected in the forward-looking statements. All forward-looking statements included in this news release are based on information available to the company on the date hereof and such statements speak only as of the date hereof. The company assumes no obligation to update any such forward-looking statement. Prospective investors should also review the risks and uncertainties listed in the company's most recent annual report on form 10-K and the company's reports on forms 8-K and 10-Q filed with the United States Securities and Exchange Commission, including management's discussion and analysis of financial condition and results of operations and the risks described therein from time to time.

A MODERNIZED grid platform for a clean energy future

The modern electric grid is the platform to enable a lower-carbon future for all sectors of the economy, from utilities to transportation to industry.

Our world is changing — and so is how we create and use power. Until recently, electricity has flowed pretty much as it had for more than a century — in a one-way stream from where it’s generated to where it’s used. But new smart grid technologies create a two-way exchange of electric power and information that helps us make our system more efficient and more reliable for customers. The modern grid will empower customers to take advantage of the cleanest energy sources, lower their overall household energy spending and partner with their utility to help decarbonize our economy.

The smart grid allows us to work in collaboration with customers to integrate renewable energy and other technologies that improve efficiency and drive decarbonization. These efforts can be something as simple as customers installing solar panels to reduce their electric bills, which also play an integral part in addressing climate change. In essence, the modern electric grid is the platform to enable a lower-carbon future for all sectors of the economy, from utilities to transportation to industry.

At Portland General Electric, our mission is to connect customers with what matters most, and our imperatives are to address climate change and ensure equity in the transition to a clean energy future. We are enhancing our grid to enable a seamless platform that launches our economy into an affordable, equitable, resilient, safe and clean energy future. These enhancements include:

- The increasing availability of clean, renewable sources like wind and solar.
- The use of electricity for more things like electric vehicles and heat pumps.
- The integration of new, geographically diverse energy markets.
- The deployment of new technologies like storage, communications networks, automation and control systems for flexible loads and distributed generation.
- The development of connected neighborhood microgrids and smart communities.
- The use of data and analytics to better predict demand and support energy-saving customer programs.

Building on our foundational infrastructure, nearly 130 years in the making, PGE is creating an electric grid that’s more flexible, resilient and integrated — in a word, smarter. The modernized grid complements our transmission and distribution system operations as we continue to harness new technologies and move toward our clean energy future.

Preparing for the future

Between now and 2050, we estimate that our service area will need about 10 to 15 gigawatts of new renewable resources to transition to a clean energy economy. While this amount is within the total renewable resource potential of our region, it represents a ten-fold increase in our current renewables. Expanding our use of energy storage will also help integrate new renewable resources while supporting grid operations. Furthermore, by updating our communications and control systems, we’ll support new customer technologies, smart cities and more efficient grid operations.

Integrating our grid and markets

As we look forward, building the smart grid on our distribution system foundation requires the integration of multiple levels of our generation, transmission, distribution and customer systems. Grid stability has traditionally been managed on the transmission system, but this must expand to include the distribution system. Ultimately, an integrated grid will accelerate our deployment of renewable energy, create better experiences for customers, support system-wide optimization and lower energy costs for everyone.

This integration is also key to obtaining the lowest cost renewables for customers. With more renewables being added to the system, there are times when their variable output outstrips customers’ need for power. As a result, that low cost renewable energy is often curtailed. Because PGE is part of an integrated Western grid, we’re able to take advantage of that low-cost resource for our customers whenever possible. We support enabling customers who want to install distributed resources like rooftop solar. Though when it comes to the lowest cost renewable energy available, that usually isn’t coming from your neighbor’s roof — it’s grid-scale wind projects or the excess renewable energy generated elsewhere on the Western grid.

RAPID ADOPTION OF NEW TECHNOLOGIES

From now to 2030, we estimate:

We’ll need about **2.5 times the wind and solar we have today** to meet customer demands with renewable energy.

We’ll see a **ten-fold increase** of energy storage capabilities on the grid.

Demand response programs will **increase ten-fold**.

Electric vehicles charging on the grid will **increase twenty-fold**.

STRATEGY IN ACTION

Meeting demand on the hottest day of the year

On August 3, 2017, our service area reached a record 105 degrees Fahrenheit — and PGE reached an all-time record summer energy peak at 3,974 MW.

Prior to the heat wave, we had integrated data from our smart meters with our outage management system to identify transformers that needed to be upgraded or replaced. We had also implemented 13 MW of demand response and other dispatchable resources. Finally, we had upgraded substations with advance communications and control systems. All our work kept customers comfortable on the hottest day of the year.

IN THE FUTURE, MAINTAINING A JUST AND EQUITABLE ENERGY SYSTEM MEANS RECOGNIZING THAT ENERGY IS AN INTEGRAL PART OF THE FABRIC OF OUR SOCIETY THAT IS GROWING IN IMPORTANCE

Energy for everyone

As the state's largest electric utility, our social compact has been to keep energy affordable and accessible to all customers. We have worked over the years with partners to create programs and policies to help customers who have historically experienced systemic and social barriers to affordable and reliable energy because of economics, geographical location or language barriers. For example, working with Community Action Partnership Agencies and counties, we have a system that makes available low-income bill payment assistance, low-income weatherization, time payment assistance and other ways to help customers pay their bills.

In the future, maintaining a just and equitable energy system means recognizing that energy is an integral part of the fabric of our society that is growing in importance. It also means thinking creatively about how communities benefit from the clean energy future, from access to clean technologies to jobs at PGE and elsewhere. Maintaining a just and equitable energy system means embracing the role we play as conveners of access to healthier, more equitable resources. When the community bands together to do their part to lower costs and support for cleaner alternatives, the benefits are far reaching.

CREATING AVAILABLE, FLEXIBLE ENERGY

In this new era of dynamic electricity use, PGE is integrating flexible electricity use and generating resources while driving affordability and accessibility. This paper outlines a number of focus areas, projects and plans designed to help us meet our goals. We are working to apply an equity and inclusion lens to all we do, acknowledging that we are learning more and trying to get better at this as we move forward.

STRATEGY IN ACTION

Salem Smart Power Center: Energy storage and grid frequency stabilization

The Salem Smart Power Center was developed by PGE and our partners as part of the largest regional smart grid demonstration at the time — the Pacific Northwest Smart Grid Demonstration Project.

The project used state-of-the-art storage batteries to show how variable renewable sources, such as solar and wind, may be stored for later use. When power sagged briefly on the regional transmission system in February 2015, the batteries immediately fed 5 MW back onto the grid to help stabilize grid frequency.

Greater flexibility with energy storage

Historically, utilities have been able to alter generation to balance energy supply with demand, which fluctuates throughout the day. To maximize the use of renewable resources like wind and solar, which generate variable amounts of power during the day, flexibility must increase. Energy storage systems like batteries and electric vehicles, store electricity during periods of high generation and provide it back to the grid during peak usage times. PGE is turning to energy storage as a way to leverage more renewable resources and maintain reliability, while helping regulate the grid. Looking to the future, when used in conjunction with microgrids, energy storage can also supply power to customers during outages. These local microgrids can meet the needs of customers in a particular area during wide-area events impacting the grid.

More efficiency through automation and control

By automating and optimizing our operations, we can make our transmission and distribution (T&D) system smarter than ever. We're deploying advanced sensing equipment and automation across our system. We'll further enhance grid efficiency through voltage optimization, which improves energy efficiency and reduces energy usage.

Imagine a grid that can automatically identify outages, diagnose problems and restore power to customers. Distribution Automation (DA) uses digital sensors and switches to manage the flow of power without manual intervention. This can shorten the duration of outages and reduce the number of impacted customers by two-thirds, leading to greater reliability and cost savings.

IMAGINE A GRID THAT CAN AUTOMATICALLY IDENTIFY OUTAGES, DIAGNOSE PROBLEMS AND RESTORE POWER TO CUSTOMERS

Lower costs through flexible loads

When we can reduce the demand on our grid during peak times, we can deliver power at lower costs. Flexible load strategies, such as demand response, include customer programs like flexible pricing, building management systems, smart thermostats and smart water heaters — all of which help us balance power supply with power use by shifting load to non-peak times. From 2016 to 2021, PGE will increase demand response capacity in our service area by more than 500 percent. Our approach places PGE as a leader among utilities in the Pacific Northwest.

Demand response strategies also empower customers to control their power costs while keeping long-term prices low for our entire community. For example, as part of our smart thermostat program, customers save money by telling their thermostats to make decisions based on the cost of energy, the weather and comfort.

Smarter decisions with analytics and forecasting

Data, when coupled with analytics, are powerful. PGE is learning more about the demands on our grid and how to bring energy to customers more effectively by analyzing data from smart meters and other sources, including distributed energy resources.

Smart meters are fundamental to our smart grid, and we've been using them across our system for a decade. These meters, along with advanced weather forecasts, help predict how much electricity customers use on hot summer days or how much energy is being produced from sources like rooftop solar. PGE will monitor voltage in near-real-time to help identify abnormal conditions and analyze outage data to determine the cause, so we can shorten restoration times or avoid the outage altogether.

Better protection with physical and cyber security

As systems become more sophisticated, it's critical that we continue to protect our energy delivery, data and employees against both physical and cyber threats. Our Integrated Security Program focuses on the safety, protection and reliability of our operations and information. This means anticipating business needs and maintaining our security expertise so we can respond quickly to threats and be responsible stewards of customer information.

A reliable, resilient foundation

By strengthening the safety and reliability of our grid, we can ensure the best experiences and opportunities for customers. We're focusing our efforts where they'll make the most impact. This involves replacing aging equipment, redesigning parts of our T&D system and targeting areas prone to

weather-related outages. To prepare for a grid with two-way power flow, we are proactively integrating modern equipment that includes enhanced monitoring and control. These enhancements will allow us to partner with customers to build resilient microgrids, limiting widespread outages during major storms or earthquakes.

STRATEGY IN ACTION

Operational technology enables market access

Energy market participation requires the control of generation resources and significant data about the grid to ensure effective dispatch of resources. To support participation in the Western EIM, PGE deployed new operational technology.

- Telecommunications infrastructure allows data exchange with market operators.
- High-accuracy meters measure energy exchange.
- Supervisory Control and Data Acquisition (SCADA) systems allow real-time monitoring and detailed system modeling.
- Automatic Generation Control (AGC) systems enable remote, efficient dispatch of energy resources in conjunction with market and system needs.

INTEGRATION: BETTER TOGETHER

In the deeply decarbonized energy future we envision, electricity systems will efficiently integrate vast amounts, sizes and types of renewable sources, as well as new technologies. From modernizing our communications to determining where distributed energy resources will offer the most value, integration is a key theme in our modernized smart grid.

Fast, secure data with upgraded communications

For our grid to be truly integrated, all equipment, devices and systems — including those at customer premises — must communicate with each other and PGE quickly and securely. PGE is developing new capabilities for data and systems interoperability that will enable us to ingest large volumes of data from generation, transmission, distribution, meter and home appliances to drive even more efficiencies in how we manage energy. Visibility into, and integration of, this data is critical in our path to create the smartest and cleanest energy for customers. We're also continually investing in our fiber optic network, and in 2016, PGE purchased wireless communication spectrum that covers our service area as part of a long-term strategy to support our smart grid.

STRATEGY IN ACTION

Rush Hour Rewards: Smart thermostats save money

In 2015, PGE launched a smart thermostat program. The Rush Hour Rewards program achieved large demand reductions, averaging about 0.8 kW per customer in the summer — the equivalent total savings of about 17 kWh.

Today, about 4,800 PGE customers are enrolled in Rush Hour Rewards, with a capacity of 3.8 MW. Our goal is to reach enrollment of 15,500 thermostats for 5.44 MW of demand response.

More value with Distribution Resource Planning

Customers are bringing more distributed generation resources, like rooftop solar, onto the grid. These will play a key role in our clean energy future. PGE is working to ensure that all customers can benefit from distributed energy resources, which can lower energy costs for the community as a whole, especially when paired with energy storage and flexible loads. PGE is developing a Distribution Resource Planning (DRP) process in conjunction with our Integrated Resource Planning (IRP) and Transmission Planning processes. As customers add new

WE WANT TO WORK WITH CUSTOMERS TO DEPLOY DIVERSE ENERGY SOLUTIONS, ENABLING THEM TO CONTRIBUTE TO OUR DECARBONIZED ENERGY FUTURE

technologies — like EVs, heat pumps and rooftop solar — we will continue to model, customize and optimize the system. This involves forecasting where distributed energy resources will be installed on the system, planning and prioritizing locational modernization, and engaging in public and regulatory processes. We want to work with customers to deploy diverse energy solutions, enabling them to contribute to our decarbonized energy future. Together, we will increase efficiency and decarbonize.

A strong core with integrated operations

Our modernized grid must have a strong center of operations that fully monitors and integrates new energy resources and flexible loads, along with traditional utility operations and community resiliency initiatives.

As generation sources are added to our distribution system, we'll need to evolve our conventional way of balancing load and generation on the grid. In 2017, PGE joined the Western Energy Imbalance Market (EIM) — a real-time energy wholesale market that automatically dispatches the lowest-cost electricity generating resources available to customer needs within the hour, while optimizing use of renewable energy over a seven-state region (plus a Canadian province). Our participation in the EIM is managed through our operations center, where we will also soon house our Advanced Distribution Management System (ADMS). This will integrate our smart grid with distributed energy resources and demand response systems. In effect, our operations center will soon be the brain that processes signals from our modern smart grid, enabling optimal system operations.

Extending market access

The evolution of our grid and technology investments positions PGE to partner with customers on the selection, integration and operation of energy resources. We have a unique ability to support customers' specific goals while maintaining the lowest-cost solutions for reliable grid operations. We already realize value in aggregating customer generators, which fills an important role in providing reliability services during grid disturbances, while also serving the needs of their owners as localized back-up power.

Additionally, we have demonstrated our ability to achieve value in multiple energy markets and have already implemented the systems that allow for real-time trading in the Western EIM. Our demonstrated competency in leveraging market opportunities is a great fit for customers who seek value from their energy assets by accessing those markets.

SUMMARY

PGE's proactive investments in an integrated smart grid platform are enabling the clean energy future that we, together with customers, envision. With a modernized grid, we will:

- Accelerate the path to clean, renewable energy sources while maintaining equity, efficiency and reliability.

- Foster the adoption of distributed energy resources, and ensure that they are fully integrated and backed by system-wide resiliency and security.
- Improve automation throughout the grid to create further efficiencies, increasing reliability for customers.
- Integrate customer technologies to enable transportation electrification, smart communities and customer choice.
- Ensure customers can participate in the smart grid, help address climate change and reduce their overall spending on energy.
- Provide great family-wage clean energy jobs with a diverse workforce that reflects the communities we serve.
- Welcome partnerships with other utilities, industries and customers. Initiatives like the Western Energy Imbalance Market prove utility collaboration and benefits across the region are possible, both in the form of more efficient operation of the system and the potential for better utilization of renewable energy resources.

As we move toward our modernized grid, we are prioritizing our investments based on what customers want today, as well as their expectations for tomorrow.

Portland General Electric's 2019 Integrated Resource Plan embraces the positive change that is shaping our industry, while prioritizing universal access to clean, affordable and reliable electricity.

This is the first plan developed since we made our commitment to cut PGE's greenhouse gas emissions by more than 80% by 2050. It proposes measured steps we can take today to address the climate crisis, while allowing flexibility for adjustments as technology and policies continue to evolve.

This document underscores our commitment to transparency and collaboration. We engaged customers and stakeholders throughout its development, and their insights and feedback were instrumental in shaping our resource strategies.

This IRP also embodies the spirit outlined in our **"Vision for a Clean Energy Future."** Since we introduced our vision in 2018, we have been accelerating the transformation of our company:

- We announced the Wheatridge Renewable Energy Facility, the first of its scale to combine wind and solar energy with battery storage.

- The Boardman plant will cease coal-fired operations at the end of 2020.
- We are working to advance electrification in other areas of the economy, especially the transportation system, which accounts for 40% of Oregon's GHG emissions.
- We are enhancing reliability by modernizing our systems to create a smarter, more resilient grid.

Our 2019 IRP is the culmination of a multi-year research and engagement process — our most exhaustive analysis ever. After constructing and testing 43 different portfolios, we identified actions needed between now and 2025 to move us forward on our path to our 2050 goal. The plan calls for:

- 150 MWa of renewable resources by 2023.

- A similar amount (157 MWa) of cost-effective energy efficiency.
- Increased reliance on demand response to help balance sources and uses of electricity during peak months. This includes 141 MW during winter months, 211 MW during summer months and 4 MW of customer battery storage.
- Additional actions to help meet capacity needs as a result of expiring contracts and the retirement of baseload coal plants like Boardman.

The energy industry is undergoing a period of profound change and uncertainty driven by climate change, new technologies and changing customer expectations. By incorporating maximum flexibility

into the plan, we will be able to accommodate shifts in needs, in consultation with the Oregon Public Utility Commission and our stakeholders.

We believe our 2019 IRP represents the very best path forward and welcome feedback from our customers and stakeholders during the coming review process. Combatting the climate crisis while ensuring universal access to reliable, affordable electricity demands leadership, vision and commitment.

It's a call for all of us to work together for a clean energy future for Oregon.

Sincerely,

Maria Pope | President and CEO

Executive Summary

Portland General Electric (PGE, or the Company) is proud to submit our 2019 Integrated Resource Plan (IRP) for consideration by our customers, stakeholders, and the Public Utility Commission of Oregon (OPUC, or the Commission). In 2018, we made a simple but daunting commitment to lead the transformation to a clean energy future for our customers and our corner of the Pacific Northwest. We made that commitment to lead because we believe combatting climate change while ensuring universal access to reliable and affordable electricity is a societal imperative, and that it will not happen without leadership, vision, and commitment. We also have an obligation to ensure that the electric system transformation does not leave anyone behind, with all customers sharing in the benefits and opportunities of a clean energy future. Our 2019 Integrated Resource Plan is our first long-term plan since making that commitment, and it incorporates this vision for our clean energy future. It shows a pathway to reach our long-term goals given what we know today, and acknowledges the vast uncertainty that faces our industry in the coming decades. We propose measured near-term actions to set us in the right direction while ensuring that we can continue to deliver affordable and reliable electricity. Our plan focuses on three major steps to meet commitments to customers in service of our shared clean energy future.

1. Engage our customers around new technologies and programs.

Our plan asks that everyone play their part in creating a clean energy future. To help us, we will ask our customers to engage with us in new ways.

Energy efficiency. PGE has long used energy efficiency (EE) to deliver low-cost and low-carbon results for our customers. We estimate that, with the help of our customers, we currently avoid about one million metric tons of greenhouse gas emissions (MMtCO₂e) per year with energy efficiency investments made since 2010. That's equivalent to taking about 150,000 cars off the road or about 17 percent of our annual greenhouse gas (GHG) emissions. Our plan calls for continued investments in cost-effective energy efficiency, which we estimate could avoid an additional 0.7 MMtCO₂e per year by 2025.

Distributed flexibility. With distributed flexibility, we can use the technologies and energy behaviors of our customers (in their home or business) to provide the same services and value that power plants and grid investments provide. This includes demand response programs, such as installing smart thermostats and smart electric vehicle (EV) chargers, as well as programs that allow customers to help support the grid with their backup power and battery storage systems. Under our plan we estimate that by 2025 our distributed flexibility programs will avoid the need for approximately 200 MW of conventional generation, about half the size of the Carty Generating Station. And we expect these programs to continue to grow as more of our customers adopt new clean technologies, like EVs, over time.

These distributed energy resource (DER) programs are critical to our ability both to drive carbon out of our economy and to maintain reliability in the electricity system at a low cost.

2. Decarbonize our energy supply as cost effectively as possible.

To reach our long-term decarbonization goal, we will need additional renewable resources, like wind and solar, to drive greenhouse gases out of our generation portfolio. Specifically, we estimate that we will need to add at least 50-60 MWa¹ of new renewables every year for the next thirty years. To make meaningful progress while taking advantage of continued cost declines and the limited remaining availability of federal tax credits, our plan calls for additional renewables in the near term. These renewables will expand our renewable portfolio and complement the voluntary options, like our Green Tariff, that allow customers who so choose to decarbonize even faster.

Renewable procurement. Our plan calls for an additional 150 MWa of new renewable resources by 2023, with conditions that will ensure low-cost outcomes for our customers. We estimate these renewables will save about 0.6 MMtCO₂ per year through 2050. Our near-term plan will help us make real progress toward our goal while maintaining flexibility to respond as conditions change in the future.

3. Maintain reliability by leveraging what we have today and embracing new clean technologies.

Our plan identifies the potential need for significant amounts of additional resources to maintain reliability in the mid-2020s, due in part to the loss of about 350 MW of capacity as contracts that we've signed for resources in the region expire. During this same time, we expect the Pacific Northwest region to require additional resources due to retiring coal plants. Forecasts also show that the costs of new clean technologies, like energy storage, will continue to decline. We propose a staged process to allow us to take measured actions that support reliability in the face of continued uncertainty.

Pursue cost-competitive existing resources. To continue to drive down both carbon and costs, it is essential that we make the best use of resources that are already available in the region. Our first step to ensuring reliability is to seek agreements for capacity on existing resources in the region to the extent that they are available and cost-competitive.

Clean technology procurement. If, despite our other actions, we still forecast a potential reliability shortage in the mid-2020s, we plan to conduct a competitive solicitation for new non-emitting resources that support reliability. This could include battery storage, pumped hydro, renewable resources, or combinations of renewables and storage. The solicitation would exclude new fossil fuel-based generation.

When taken together, we believe these actions will allow us to meet our customers' needs while maintaining affordability in a way that is consistent with our values and the values expressed within the public process that supported the development of this plan.

The following sections briefly summarize the observations, assumptions, and analysis that underpin our plan.

¹ An average MW (or MWa) is shorthand for the amount of energy that a resource produces on average over the course of a typical year. Because renewables and many power plants do not produce energy all of the time, they typically produce fewer MWa than their total generating capacity.

ES.1 A Changing Energy Landscape

The 2019 IRP was developed against a landscape of rapid growth in clean energy. Our customers, and electricity customers across the country, want clean energy and expect us to act to help avert the climate crisis. Policymakers in Oregon and around the West have responded with new state policy proposals that support decarbonization through both economic signals and clean energy mandates. Many states in the West have adopted aggressive new clean energy policies that further the expansion of renewable resource development and the retirement of emitting thermal resources, including California, Washington, New Mexico, Nevada, and Colorado. In Oregon, the legislature contemplated House Bill (HB) 2020, which would have authorized a cap and trade program—called the “Oregon Climate Action Program”—starting January 1, 2021. HB 2020 would have helped facilitate decarbonization of our energy supply and accelerated transportation electrification, and would have protected our customers from unnecessary price impacts while doing so. PGE joined environmental and consumer advocates, organized labor, businesses, family forestland owners, rural economic development organizations, and other utilities in supporting passage of HB 2020. Although this bill did not pass during the 2019 legislative session, PGE is committed to reducing our greenhouse gas emissions by more than 80 percent by 2050, consistent with our proportionate share of the state’s economy-wide GHG reduction goal, and will continue to engage in and advocate for policies that are consistent with our strategy while protecting affordability and reliability.

Amidst broad consumer- and policy-driven change, clean energy technology companies are rising to the challenge. As a result, cost declines for wind, solar, and battery technologies continue, and clean technologies are increasingly competitive with conventional fossil fuel-based generators. The make-up of the grid has shifted quickly and wholesale electricity markets in the West are increasingly experiencing the availability of zero or negative marginal-cost renewable power. Simultaneously, the retirement of thermal generators has accelerated the potential for capacity shortages in the West and reinforced the need for both sound utility planning and regional solutions.

ES.2 Our Planning Process

Integrated resource planning provides a thoughtful way for PGE and the region to pursue and embrace the positive change that our industry is undergoing, while ensuring that our customers have access to affordable and reliable energy. The process allows us to align the way we do business with our customers’ values, as well as local and state energy policies. To engage the public in the development of our plan, we host a public process in which we provide information and request feedback to help guide our decision-making.

Before we began work on the 2019 IRP, we engaged stakeholders in a conversation around guiding values. We heard that affordability, sustainability, and transparency were paramount to many of our stakeholders as they engaged in the IRP process. We kept these values in mind throughout our planning and took tangible steps to be responsive to what we heard. Specifically, we shared draft analyses more frequently, requested feedback on specific design questions, invited stakeholders to submit informal comments throughout the process, and modeled specific portfolios requested by stakeholders.

Over the 17-month public process for the development of the 2019 IRP, we held 12 public meetings, which were attended by 221 people online and in person. We received 58 written comments, five portfolio requests, and hosted our first community listening session to seek feedback from traditionally underrepresented groups that work within the communities we serve. We are grateful to everyone who chose to participate in our public process and hope those who participated will see their vital feedback reflected in our plan. While we received generally positive feedback about our efforts to engage stakeholders that traditionally participate in our process, we were much less successful in bringing new perspectives into our process. This will be an area of continued focus for PGE as we work to engage the communities we serve in our planning and decision-making processes.

To address both the evolving energy landscape and the feedback that we heard throughout our process, we designed and implemented the 2019 IRP with a focus on four key themes: decarbonization; customer decisions; uncertainty and optionality; and technology integration and flexibility. These themes encompass some of the most pressing questions facing our industry today and in the coming decades.

- **Decarbonization.** We are committed to enabling local transformation to a clean energy economy. By 2050, we will reduce our greenhouse gas (GHG) emissions by more than 80 percent and help decarbonize other sectors in the economy by enabling the adoption of new clean electric technologies, like EVs. To support these goals, we considered decarbonization and the clean energy transition through several new innovative analyses within the IRP, including our Decarbonization Study² and related Decarbonization Scenario,³ carbon pricing reflective of a potential cap and trade program in Oregon,⁴ a scoring metric reflecting portfolio performance in a carbon-constrained future,⁵ and incorporation of market-based EV forecasts throughout our analysis.⁶ These components of our plan help to ensure that PGE will continue to drive GHGs out of our energy economy and that we will be well positioned to serve our customers in a clean energy future.
- **Customer decisions.** Increasingly, customer decisions around their energy use and the source of their energy are impacting the electricity sector, including long-term planning. In the 2019 IRP, we address customer decisions through a comprehensive study (the Navigant “DER Study”) of customer adoption of DERs and customer participation in distributed flexibility programs (including demand response and dispatchable customer storage).⁷ We also tested sensitivities related to customer participation in voluntary renewable programs.⁸ Our goal in these exercises is to ensure that our plans are robust across a range of potential customer

² The Decarbonization Study can be found in [External Study 1. Deep Decarbonization Study](#).

³ See [Section 1 Decarbonization Scenario](#).

⁴ See [Section 1 Carbon Prices](#).

⁵ See [Section 1 Scoring Metrics](#).

⁶ See [Section 1 Electric Vehicles](#).

⁷ Information from the DER Study is referenced in [Chapter 1. Resource Needs](#) and [Chapter 1. Resource Options](#). The study can be found in [External Study 1. Distributed Energy Resource Study](#).

⁸ See [Section 1 Voluntary Renewable Program Sensitivities](#).

decisions in the future and to ensure that utility actions and customer actions remain compatible and coordinated.

- **Uncertainty & optionality.** We anticipate the current rapid change in technology, policy, and wholesale markets is likely to continue in the foreseeable future. As such, our 2019 IRP provides a robust treatment of uncertainty in terms of both the range of potential futures considered and the incorporation of these futures into portfolio analysis. We consider 810 potential futures that depend on economic conditions, technological progress, natural gas prices, carbon prices, hydro conditions, and the future deployment of renewables across the West. In response to our stakeholders, we have also evolved our portfolio construction and scoring process to better reflect the value of optionality amidst these uncertainties and to better capture the risks associated with commitments to new large and long-lived energy infrastructure.
- **Technology integration and flexibility.** With the continued proliferation of renewable and distributed resources, it is increasingly important that our planning consider the challenges and opportunities associated with integrating these technologies. Building on PGE's leadership in renewable integration and energy storage analysis, the 2019 IRP incorporates a holistic evaluation of flexibility challenges and potential solutions through three related exercises: an integration cost study for renewables,⁹ a flexibility value analysis for dispatchable resources,¹⁰ and a flexibility adequacy study for our portfolio.¹¹ In anticipation of future distribution resource planning (DRP) efforts, we also provide an example of how locational value may factor into resource economic evaluation in future IRPs.¹²

ES.3 Growing Resource Needs

Our analysis to support the 2019 IRP begins with a detailed evaluation of our need for resources. PGE meets customer needs with a diverse portfolio of resources, including energy efficiency, renewables, hydropower, and thermal generation. Over time, our resource needs shift due to changes in demand, changes in our resource mix (due to retirements or expiring contracts), and policy drivers, like the Renewable Portfolio Standard (RPS).

Our analysis shows that PGE faces growing resource needs and uncertainty throughout the 2020s. As approximately 350 MW of capacity contracts expire in the mid-2020s, we face increasing needs for resources that support reliability (i.e., capacity needs), even after considering the potential impacts of distributed energy resources like energy efficiency, customer-sited solar and storage, and demand response. Under Reference Case assumptions, these capacity needs grow to 685 MW by 2025. However, uncertainties in economic conditions, DER adoption, EV adoption, and market availability suggest that our needs in 2025 could range between approximately 350 MW and approximately 1,000 MW. These estimates exclude the potential impacts to regional reliability of loads that elect to take energy service from an energy service supplier (ESS) through long-term direct access (LTDA) or

⁹ See [Section 1 Integration Costs](#).

¹⁰ See [Section 1 Flexibility Value](#).

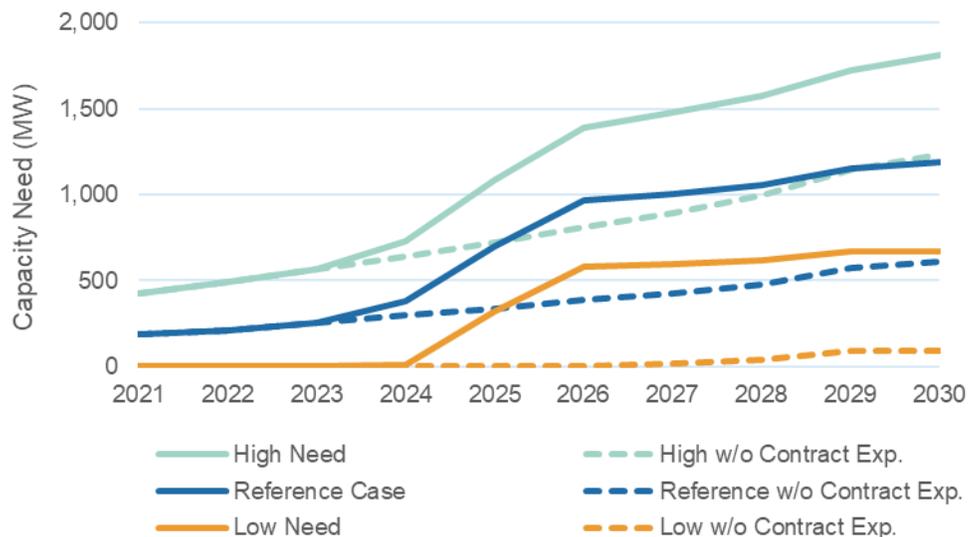

¹¹ See [Section 1 Flexibility Adequacy](#).

¹² See [Section 1 Locational Value](#).

New Load Direct Access (NLDA). In Docket No. UE 358, PGE urges the OPUC to allow PGE to plan for the capacity needs associated with these loads so that we can effectuate our role as their reliability provider as the region becomes more capacity-constrained.

Our need for new dispatchable capacity resources in the mid-2020s will depend strongly on our ability to replace expiring contracts with similar quantities of capacity. As shown in Figure ES-1 below, if we replace all expiring contracts with new contracts, on a 1-for-1 capacity basis, and our needs grow relatively slowly (as indicated by the Low Need Future), we may be capacity-adequate without new resource additions. However, if cost-competitive capacity options are not available in the market and we face more quickly growing needs (as indicated by the High Need Future), over 1,000 MW of new capacity resources may be required by 2025. The possibility of these two widely divergent scenarios requires our Action Plan to be both flexible enough for us to respond to evolving conditions and robust enough to provide for significant procurement of new resources should the identified needs persist.

FIGURE ES-1: Future capacity needs under various scenarios

Our analysis also suggests that without incremental action, our generation portfolio is expected to be short to the market on an average annual basis beginning in 2021, with the forecast market shortage generally growing into the future. By 2025, the market shortage exceeds 344 MWa in 90 percent of futures and is forecast to be 515 MWa in the Reference Case. Consistent with this finding and the potential for voluntary programs to provide incremental energy to the portfolio, we considered only those portfolios that add less than 250 MWa in incremental resources through 2025 in selecting our preferred portfolio.

Our analysis did not identify near-term needs for additional Renewable Energy Credits (RECs) to meet Renewable Portfolio Standard (RPS) obligations. Our forecasts indicate that we expect to be physically compliant with the RPS through 2029 and that banked RECs could be used to defer the need for incremental RECs until 2036. However, deferring action would preclude the opportunity to secure low-cost resources to meet near-term capacity and energy needs with clean technologies. It would also create an impractical requirement that we successfully procure 627 MWa of additional

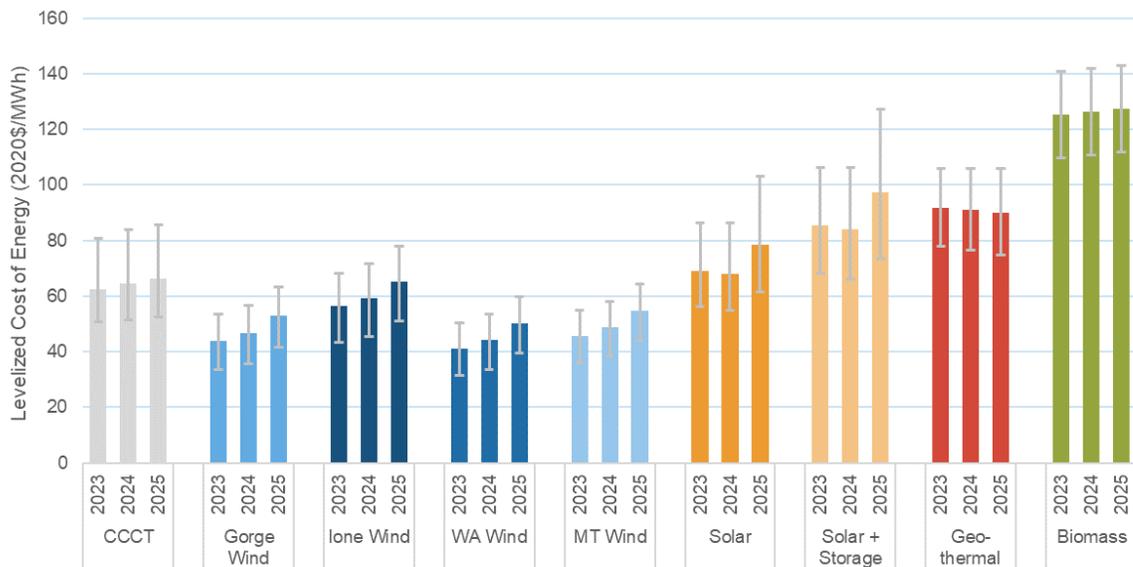

renewables over two years to comply with the RPS in 2037. We do not believe that our near-term renewable strategy should rely on such an unrealistic assumption about future procurement.

The energy and capacity needs we identified in the mid-2020s can be met in a variety of ways. For example, we can meet energy needs through a combination of purchases from wholesale energy markets and new energy resources, like wind and solar. Similarly, we can meet capacity needs through a combination of renewable resources, dispatchable capacity resources (such as thermal generators and energy storage), or contracts with other entities in the region. More information about the resource options considered in the 2019 IRP can be found in [Chapter 1](#). The remainder of the IRP focuses on the tradeoffs between these resource options and the identification of the best combination of resource options for PGE to pursue to meet our customers’ needs.

ES.4 Shifting Resource Economics

One of the primary changes influencing the electricity sector and resource planning is the continued cost decline of clean technologies like wind, solar, and battery energy storage. The combination of cost declines and the continued availability of federal tax credits in the near-term create a time-limited opportunity to secure cost-competitive clean resources to meet our customers’ needs. [Figure ES-2](#) shows the real-levelized cost of each of the generic energy resource options considered in our 2019 IRP.

FIGURE ES-2: Levelized costs of energy resource options by type and online date

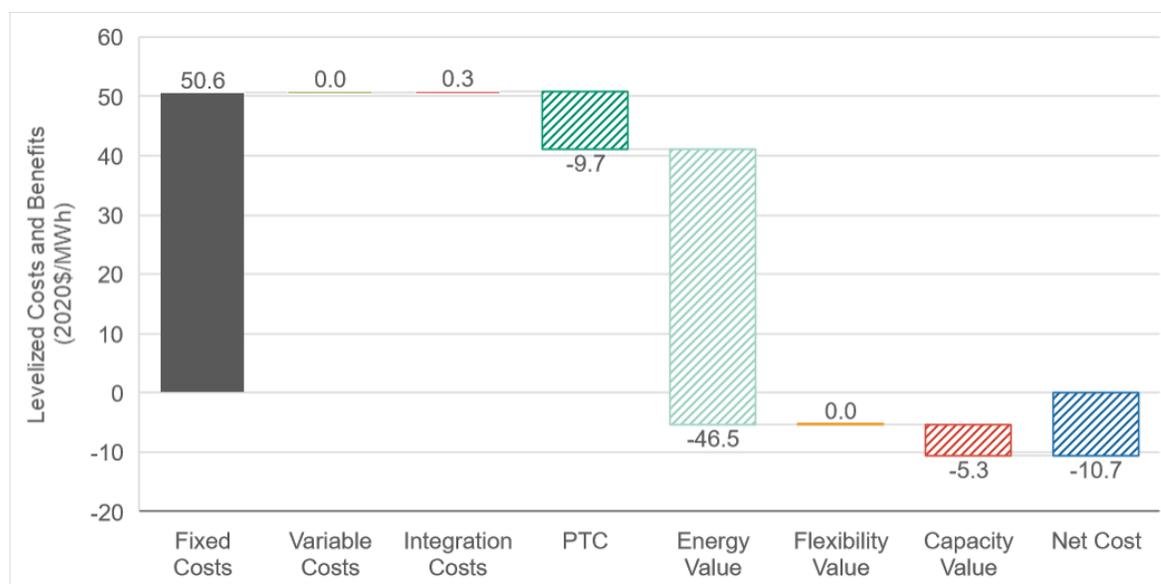

Our analysis suggests that wind resources may provide the lowest-cost energy compared to other energy resources, including combined-cycle combustion turbines (CCCTs). It also indicates that cost uncertainty is relatively large compared to the cost differences between energy resource options. This highlights the importance of taking incremental actions to procure renewable resources, while preserving optionality with respect to technology, resource type, and location in competitive solicitations.

The levelized costs also highlight the benefits of near-term renewable action to qualify for federal tax credits. Wind projects that come online by December 31, 2022¹³ may qualify for the federal production tax credit (PTC) at the 60 percent level. The PTC steps down to the 40 percent level for projects that come online the following year and then goes away. At the 60 percent level, we find that the PTC lowers the cost of wind by approximately 20 percent, providing an incentive of about \$170 million to pursue 150 MWa of wind in the near-term, rather than waiting until 2025 or later. The federal investment tax credit (ITC) provides a similar incentive for solar. The ITC scales down from 30 percent to 10 percent for projects that come online after December 31, 2023.¹⁴ We estimate that the availability of the 30 percent ITC reduces the cost of solar and solar plus storage by approximately 16 percent relative to the 10 percent ITC, providing an additional incentive to acquire renewable resources prior to 2025.

In addition to cost, we analyzed the various benefits that renewable resources bring to the system and compared them to alternative ways of meeting customer needs. We found that by helping to meet both our energy and capacity needs, wind resources are expected to bring more benefits than costs over their lifetime (see Figure ES-3). In the Reference Case, a 150 MWa Washington Wind resource that qualifies for the 60 percent PTC saves about \$180 million over its lifetime relative to a strategy of relying on the market for energy and a simple-cycle combustion turbine for an equivalent amount of capacity.

FIGURE ES-3: Costs and benefits of Washington Wind resource that comes online by December 31, 2022

While the long-term benefits of pursuing near-term renewables are compelling, our stakeholders have raised questions about whether today’s customers should be paying for resources that will benefit customers in future years. To address this question of intergenerational equity, we estimated

¹³ Our analysis considers such a project to have a 2023 online date.

¹⁴ These projects come online in 2025 in our analysis because we assume that projects that would come online in 2024 would be accelerated to December 31, 2023 to qualify for the higher level of tax incentive.

the potential average impact to retail power prices of pursuing renewables within the 2019 IRP Action Plan between 2021 and 2035. Our analysis found that pursuing near-term wind is expected to cause a small net increase in power prices between 2023 and 2026 (approximately 0.04 cents per kWh¹⁵) but is expected to result in lower power prices beginning in 2027 or 2028, relative to a strategy of meeting customer energy and capacity needs without the renewable addition. Waiting until 2026 for the same wind addition would result in larger estimated power price impacts due to the unavailability of federal tax credits (approximately 0.05 cents per kWh between 2026 and 2030) and would not result in net reductions to power prices until 2031. While we found that near-term renewable action does bring forward some costs and the associated potential for small increases in power prices, the benefits of securing federal tax credits also reduce the expected magnitude of near-term power price increases and brings forward the potential for power price reductions associated with renewables from the early 2030s to the late 2020s. The exact impacts to rates and timing of these impacts will depend on the cost and performance of acquired resources and future market conditions.

Technological innovation has also led to dramatically reduced costs for battery storage in recent years, challenging the notion that meeting capacity needs will necessarily require new fossil fuel-based resources. Our analysis suggests that by 2025, battery resources may be cost-competitive with a simple-cycle combustion turbine (SCCT). The 2019 IRP made significant progress toward better understanding the potential role of battery storage within our portfolio, particularly with the analysis of storage capacity contribution and flexibility value. However, we have identified energy storage as a critical area for additional learning. Future efforts will focus on quantification of locational value of battery storage through PGE's distribution resource planning (DRP) process, and continued refinements in energy storage methodologies in the IRP.

ES.5 Portfolio Analysis – Bringing it All Together

We constructed 43 portfolios of resource options that tested a wide range of potential strategies for meeting our near-term needs. Some portfolios tested specific resource options in isolation or tested variations in the size and timing of resource actions, while others utilized optimization algorithms to design portfolios to meet objectives of interest to PGE and/or our stakeholders. [Figure ES-4](#) summarizes the resulting resource additions through 2025.

To compare the portfolios, we evaluated each across a set of non-traditional scoring metrics as well as traditional cost and economic risk metrics. We selected the non-traditional scoring metrics based on feedback received in our public process and to account for risks not captured with the traditional economic risk metrics. We excluded portfolios that performed among the worst with respect to any non-traditional metric from further evaluation. We then identified the best performing portfolios based on their performance with respect to the traditional cost and economic risk metrics. The near-term resource additions in these portfolios are shown in [Figure ES-5](#).

¹⁵ For reference, total revenues per kWh as reported in the FERC Form 1 for 2018 were approximately 10.2 cents/kWh.

FIGURE ES-4: Resource additions through 2025 across the portfolios investigated

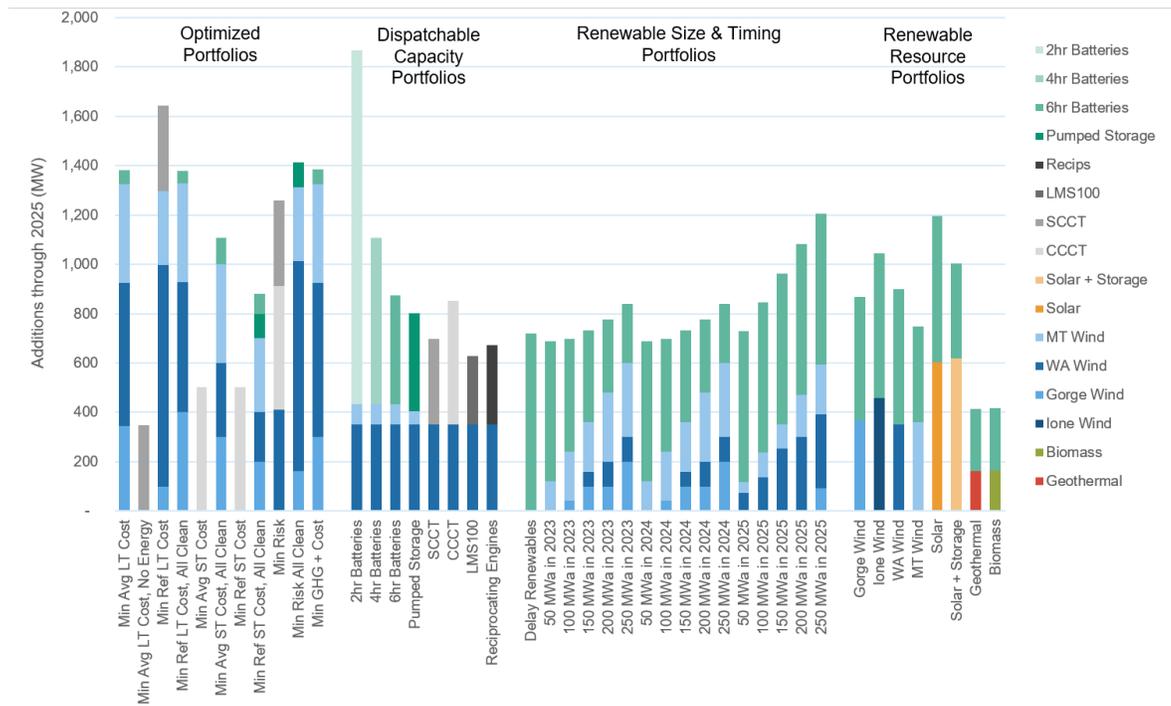

FIGURE ES-5: Resource additions in best performing portfolios

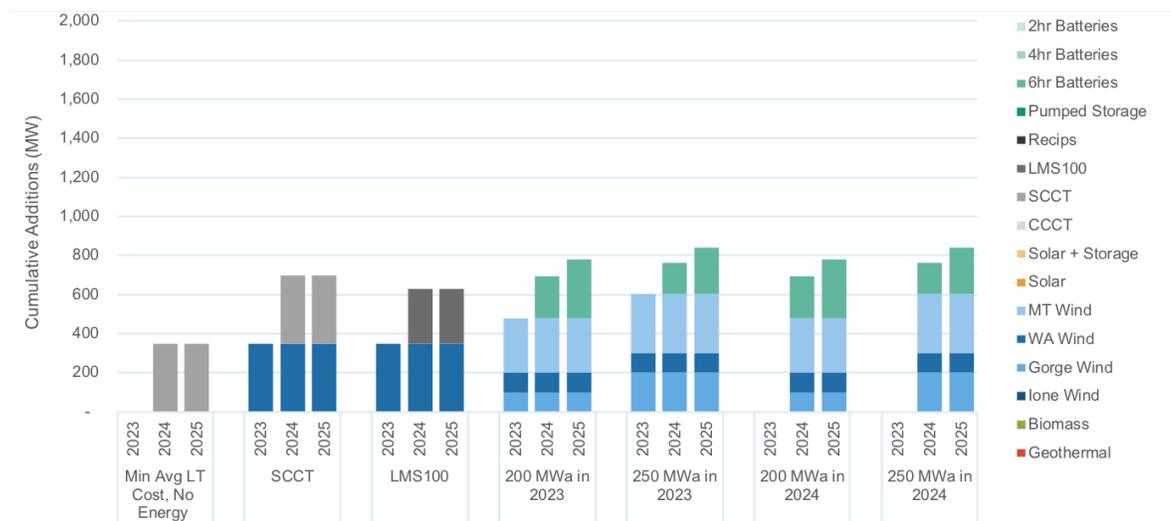

Table ES-1 and Table ES-2 list the traditional and non-traditional scores for each of the best performing portfolios.

TABLE ES-1: Portfolio scores for best performing portfolios, traditional scoring metrics

Portfolio	Category	Cost	Variability	Severity
Min Avg LT Cost, No Energy	Optimized	25,436	3,808	30,987
SCCT	Dispatchable Capacity	25,351	3,675	30,699
LMS100	Dispatchable Capacity	25,515	3,652	30,863
200 MWa in 2023	Renewable Size & Timing	25,744	3,653	30,987
250 MWa in 2023	Renewable Size & Timing	25,620	3,605	30,807
200 MWa in 2024	Renewable Size & Timing	25,804	3,648	31,043
250 MWa in 2024	Renewable Size & Timing	25,693	3,611	30,879

TABLE ES-2: Portfolio scores for best performing portfolios, non-traditional scoring metrics

Portfolio	GHG- Constrained Cost	Near Term Cost	High Tech Future Cost	GHG Emissions	Incremental Criteria Pollutants	2025 Energy Additions
Min Avg LT Cost, No Energy	25,351	6,025	15,313	108	61	10
SCCT	25,266	6,051	15,256	102	61	160
LMS100	25,430	6,067	15,418	102	265	189
200 MWa in 2023	25,713	6,099	14,919	100	0	183
250 MWa in 2023	25,577	6,097	15,009	97	0	236
200 MWa in 2024	25,773	6,093	14,977	101	0	183
250 MWa in 2024	25,650	6,089	15,080	98	0	236

The best performing portfolios share the following commonalities:

- **Customer resources:** All portfolios include all cost-effective energy efficiency and DER adoption and participation assumptions based on the Navigant DER Study.
- **Renewable resource additions:** Six of the seven best performing portfolios incorporate renewable actions prior to 2025 (four add renewables in 2023 and two add renewables in 2024). Renewable addition sizes across these six portfolios range from 150 MWa to 250 MWa.
- **Capacity resource additions:** All seven of the best performing portfolios incorporate capacity additions prior to 2025. Capacity is provided by battery storage in four portfolios, a simple-cycle combustion turbine (SCCT) in two portfolios, and three LMS100 units in one portfolio. The portfolios that incorporate battery storage add incremental capacity in both 2024 and 2025, while the portfolios that add thermal resources for capacity make a single larger capacity addition in 2024 due to thermal unit sizes. Capacity additions through 2025 range

between 238 and 299 MW in the portfolios that include storage and between 279 MW and 347 MW in the portfolios that add thermal units. Remaining capacity needs are met with the Capacity Fill resource described in [Section 1 Resource Adequacy](#).

We designed an additional portfolio, the Mixed Full Clean portfolio, to capture the most common elements across the best performing portfolios. The Mixed Full Clean portfolio met all of the screening criteria and performed among the best performing portfolios on the basis of the traditional cost and risk metrics—making it our preferred portfolio. In this portfolio, we meet our resource needs (after accounting for DERs and potential capacity contracts) with a combination of renewable resources and energy storage. Specifically, we add 150 MWa of additional wind in 2023 that qualifies for the 60 percent PTC and approximately 250 MW of energy storage by 2025 that has a duration of at least six hours. [Table ES-3](#), [Table ES-4](#), and [Table ES-5](#) summarize the cumulative components of the preferred portfolio in more detail.

TABLE ES-3: Cumulative customer resource additions in the preferred portfolio

	Reference Case			Low Need			High Need		
	2023	2024	2025	2023	2024	2025	2023	2024	2025

ES.6 PGE's Action Plan

The analysis presented in this IRP confirms that amid the rapid technological and market changes being experienced in the West, utilities, including PGE, face large uncertainties in future needs and resource economics. This IRP also demonstrates that PGE can take low-risk, near-term actions to meet near-term needs and set the company on a course to achieve critical long-term goals. In support of our goals and in alignment with our preferred portfolio, we are seeking acknowledgment of the 2019 IRP Action Plan briefly summarized below.

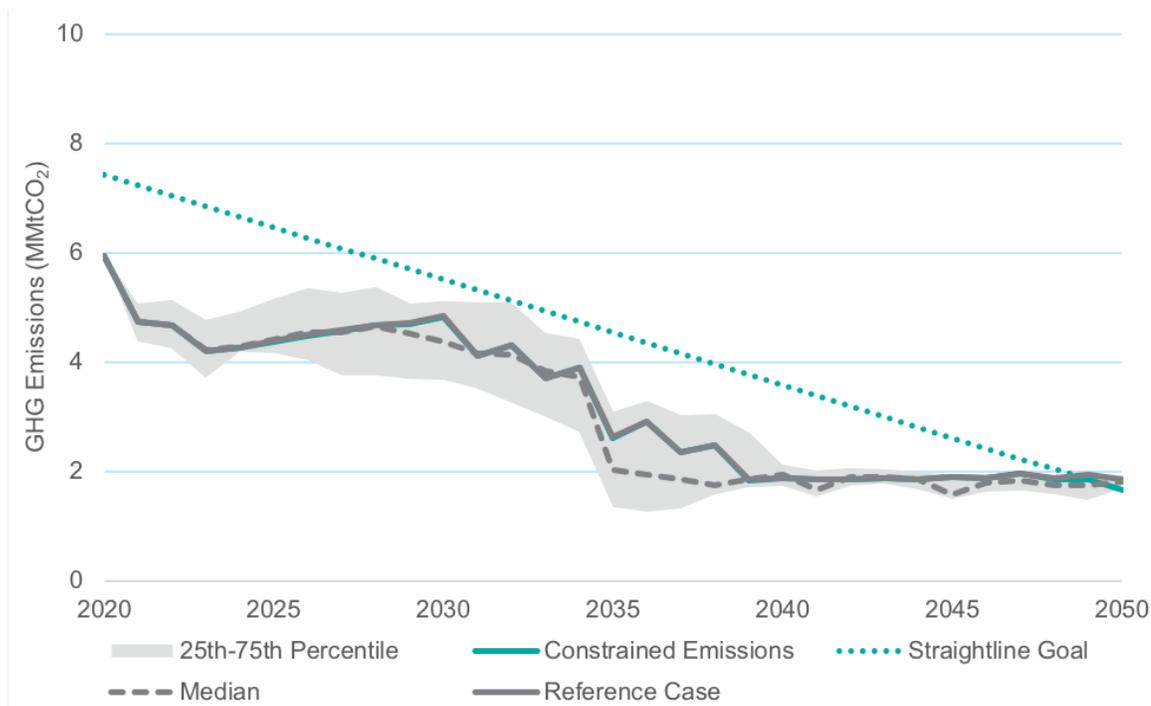

- **Customer resource actions.** Customer participation will be critical to achieving long-term decarbonization at the lowest cost to customers. Based on the findings of the Navigant DER Study, PGE proposes the following actions to support customer participation in demand side management programs.
 - Action 1A. Seek to acquire all cost-effective energy efficiency, which is currently forecasted by the Energy Trust of Oregon to be 157 MWa on a cumulative basis by 2025.
 - Action 1B. Seek to acquire all cost-effective and reasonable distributed flexibility, which is currently forecasted to include, on a cumulative basis:
 - 141 MW of winter demand response (Low: 73 MW, High: 297 MW).
 - 211 MW of summer demand response (Low: 108 MW, High: 383 MW).
 - 137 MW of dispatchable standby generation.
 - 4.0 MW of utility-controlled customer storage (Low: 2.2 MW, High: 11.2 MW).
- **Renewable actions.** Through portfolio analysis, PGE determined the best balance of cost and risk includes a near-term renewable action that contributes to meeting near-term energy and capacity needs as well as long-term renewable obligations and that qualifies for federal tax credits. PGE proposes to pursue the following action to acquire renewable resources:

- Action 2. Conduct a Renewables Request for Proposals (RFP) in 2020, seeking up to approximately 150 MWa of RPS-eligible resources to enter PGE's portfolio by the end of 2023. PGE proposes the following conditions as part of this action:
 - The Renewables RFP would be open to all RPS-eligible resources.
 - The Renewables RFP would incorporate a cost-containment screen similar to PGE's 2018 Renewables RFP.
 - PGE would return the value of RECs generated from acquired resources prior to 2030 to customers, similar to the proposal in PGE's 2016 IRP Revised Renewable Action Plan.
 - PGE plans to provide a proposal for transmission requirements for this RFP within the 2019 IRP docket.
- **Capacity actions.** To ensure that PGE can meet our future capacity needs, while taking into consideration the potential impact of uncertainties, PGE plans to conduct the following staged process to secure capacity in the 2024 to 2025 timeframe.
 - Action 3A. Pursue cost-competitive agreements for existing capacity in the region.
 - Action 3B. Update the Commission and stakeholders on the status of PGE's bilateral negotiations and any resulting impacts on capacity needs.
 - Action 3C. Conduct an RFP for non-emitting resources to meet remaining capacity needs.

In addition to meeting our near-term needs, this Action Plan will help us continue on the course to meeting our goal of reducing GHGs by more than 80 percent by 2050. We estimate that the proposed renewable action would avoid approximately 16 million metric tons of GHGs between 2023 and 2050 and would represent 5 to 12 percent of the total additional clean and renewable resources that we need between now and 2050 to hit our goal. The GHG emissions forecast associated with our plan is shown, with uncertainties, in [Figure ES-6](#) below. The trajectory reflects the effects of both near-term and outer year renewable additions, the effects of ceasing coal-fired operations at Boardman by the end of 2020, the exit of Colstrip Units 3 and 4 from our portfolio no later than the end of 2034,¹⁶ and the impacts of a potential future cap and trade program in Oregon. Our analysis suggests that with continued effort to deploy energy efficiency, implement Senate Bill 1547, and respond to potential climate and clean energy policies, we would be on course to stay close to or below our target emissions trajectory between now and 2050.

¹⁶ In [Chapter 1](#), we explore additional sensitivities related to Colstrip's inclusion in our portfolio over time.

FIGURE ES-6: Greenhouse gas emissions forecast

ES.7 Conclusion

Throughout the 2019 IRP, we aimed to design an Action Plan that reflects our values, responds to customer and stakeholder feedback, and embraces the positive change that continues to shape the electric utility industry. Oregon’s traditional, yet robust, IRP framework has aided us in these efforts. In some cases, we have proposed evolutions in how this framework may adapt to the shifting demands of customers and the opportunities afforded by new technologies. Our proposed Action Plan allows us to continue pursuing low-cost and clean technologies to benefit customers, while mitigating future risks. Our plan also gives us the flexibility to adapt and learn as conditions change and new opportunities arise. More importantly, the Action Plan provides clarity on our priorities and invites further conversation with customers, stakeholders, and the Commission. We look forward to working together in this IRP and in future planning efforts to chart the course toward a clean, affordable, and reliable energy future.

Demand Response at PGE

Andy Macklin, Shauna Jensen, Jason
Klotz

Portland General Electric

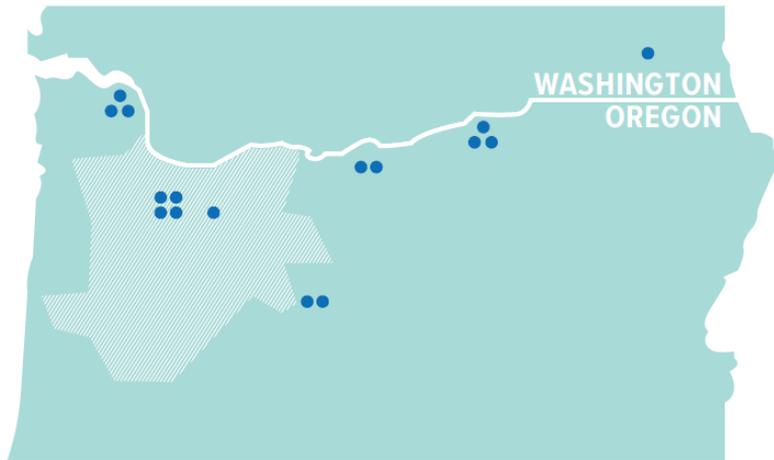

Northwest Power & Conservation
Council Public Meeting, August 2019

AGENDA

- Integrated Resource Planning
- Background on Demand Response at PGE
- Demand Response Strategy
- Portfolio Results and Forecasts

Portland General Electric is a fully integrated energy company based in Portland, Oregon.

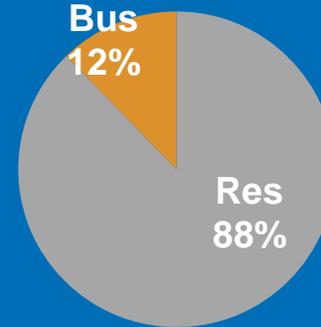

Diverse generation mix

16 major generation plants providing a cleaner energy future

Quick Facts

- 2,750 employees
- 862,764 retail customers

- 44% of State's Population
- 18.9 million MWh delivered
- Peak load*: 4,073 MW
- Summer peak*: 3,972 MW
- No. 1 renewable power program

*Peak Dec. 21, 1998, Summer Peak 2017

2019 IRP Themes

- Engage Customers in New Technologies and Programs
 - Energy Efficiency
 - Distributed Flexibility
- Cost Effectively De-Carbonize Energy Supply
 - Renewable Procurement
- Embrace Clean Technology while Maintaining Reliability
 - Pursue Cost-Competitive Existing Resources
 - Clean Technology Procurement

2019 IRP Action Plan

1.A. Acquire all cost-effective energy efficiency (157 MWa by 2025)

1.B. Acquire all cost-effective & reasonable distributed flexibility (values by 2025):

- 141 MW (Low: 73 MW, High: 297 MW) winter demand response
- 211 MW (Low: 108 MW, High: 383 MW) summer demand response
- 137 MW DSG
- 4.0 MW (Low: 2.2 MW, High: 11.2 MW) dispatchable customer storage

*Values are cumulative and at the meter

2. Conduct Renewables RFP in 2020

(~150 MWa RPS-eligible resources, online by end of 2023)

- Timing allows PGE to capture $\geq 60\%$ PTC for customers
- Propose cost containment screen similar to the 2018 Renewables RFP
- Propose to return value of RECs generated prior to 2030 to customers

3. Pursue staged procurement process to secure capacity to maintain resource adequacy, while considering the impact of uncertainties

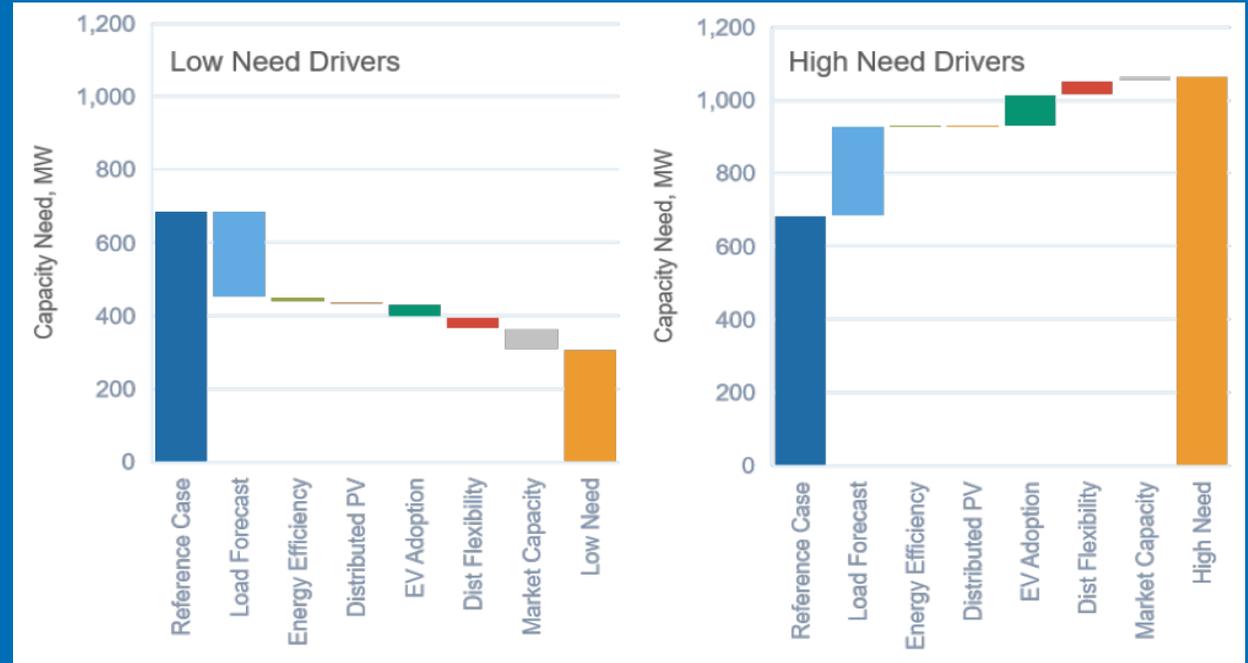

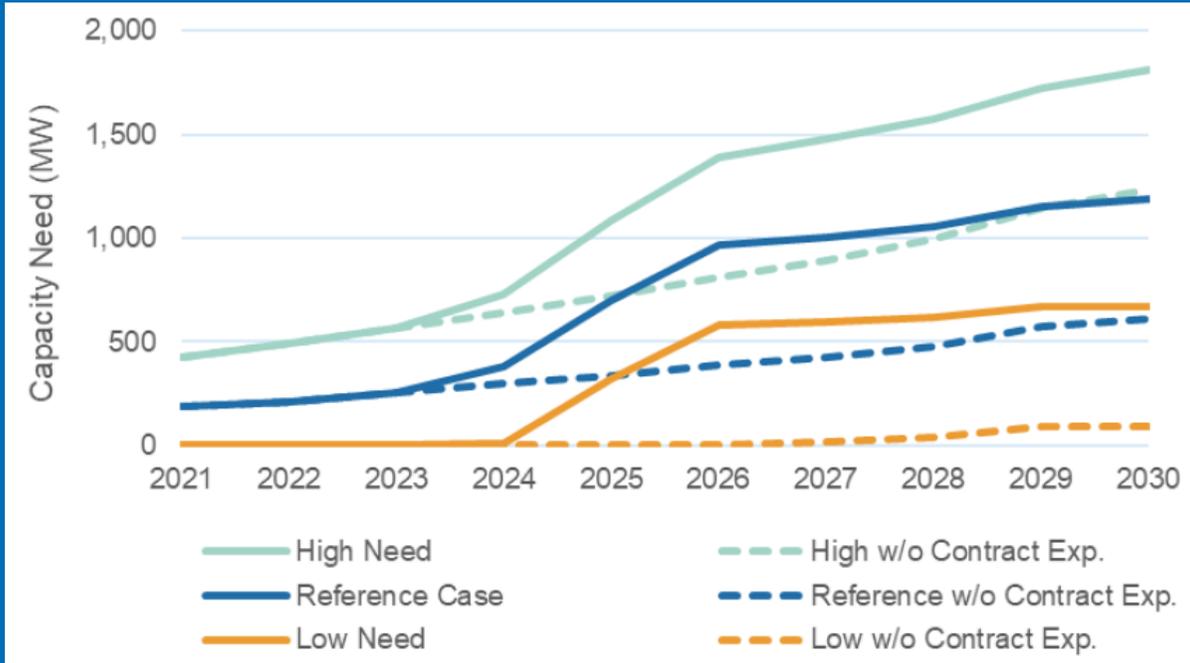

3.A. Pursue cost competitive existing capacity in the region via bilateral negotiations

3.B. Update the OPUC and stakeholders on PGE's resource needs in 2020

3.C. Conduct a Non-Emitting Capacity RFP in 2021 for capacity needs remaining after above actions

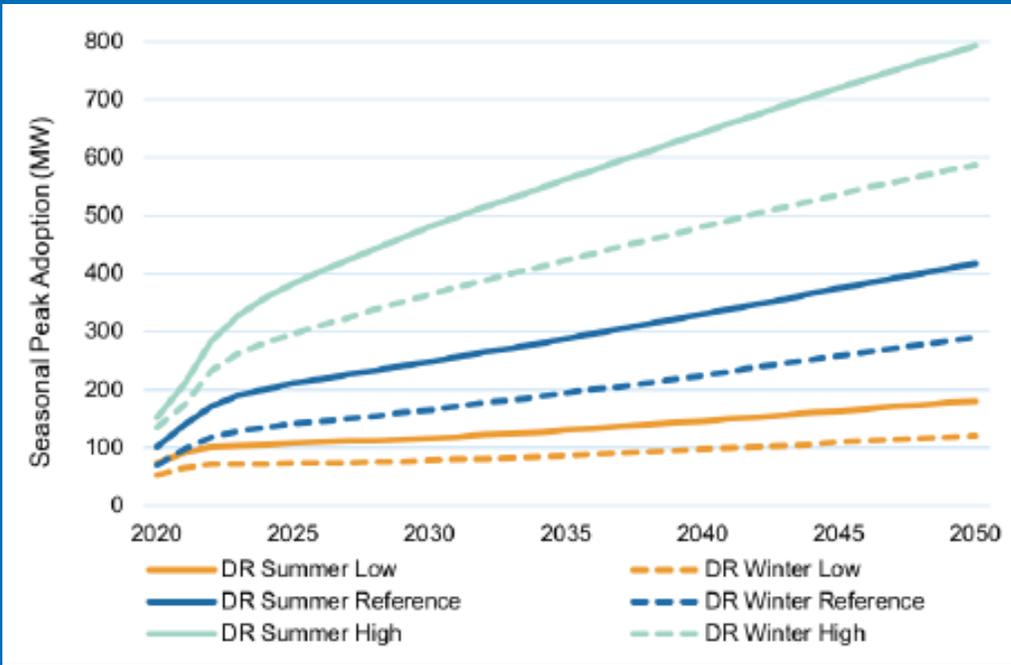

Forecast of Need

Demand Response

	Low DR	Reference Case	High DR
Technology Costs	+50% cost by 2030	Navigant reference DR cost model	-50% cost by 2030
Policies	Less favorable policy	Navigant reference policy model	More favorable policy
Carbon Prices	No change	PGE Reference Carbon Price Future	No change
TOU participation	0% residential TOU	10% residential TOU	Opt-out residential TOU

Region Dynamics

PGE initiatives:

Pilot to scale
DR

Transportation
Electrification

Community
Solar Docket

Storage
Proposal

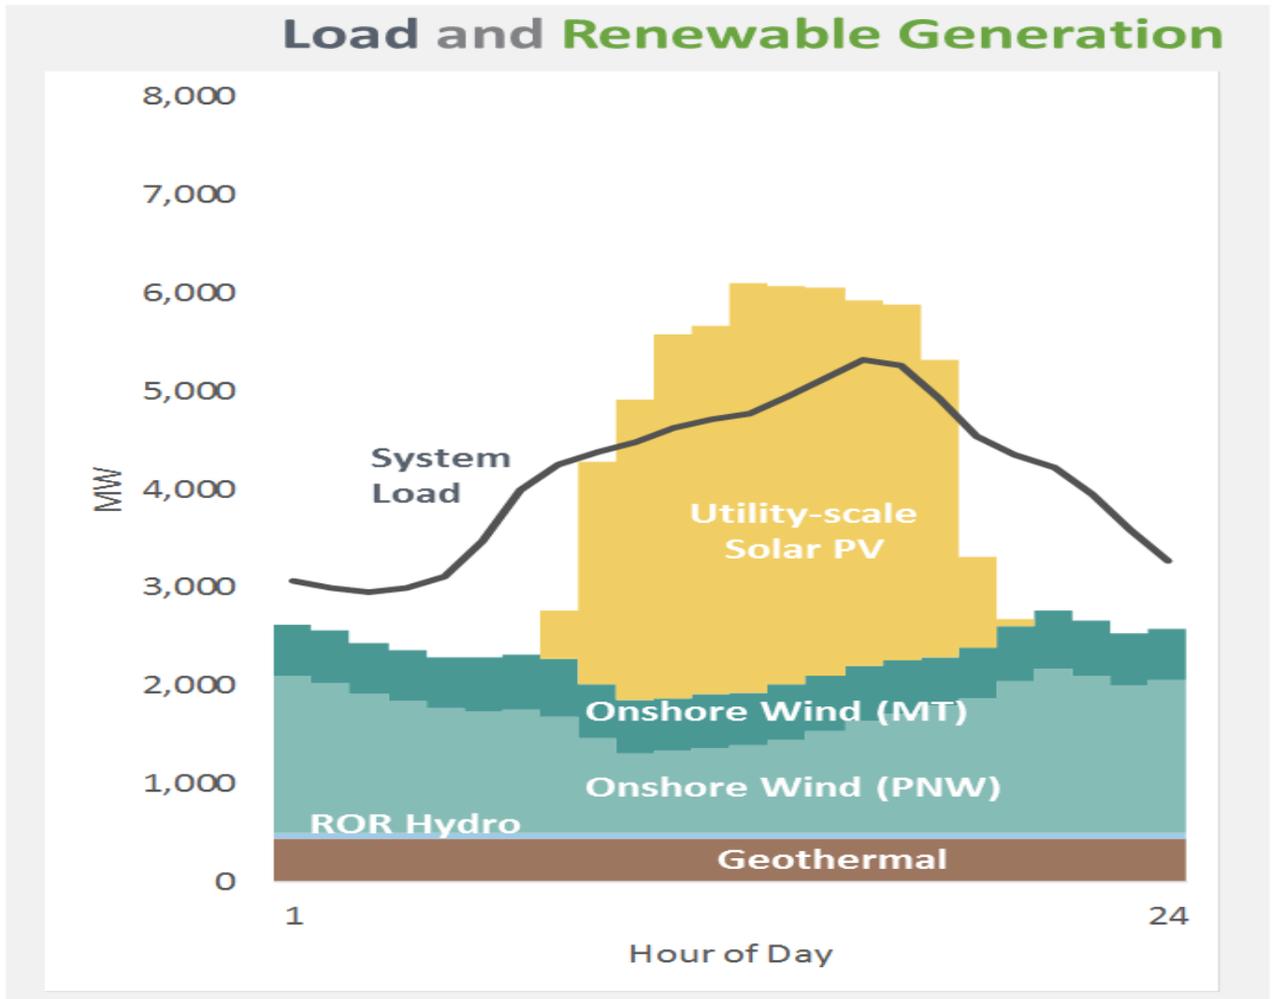

- DR/DER nascent in Pacific NW but that is changing
- NW Power & Conservation Council calls for 600 MW of DR
- OPUC requires all achievable, cost effective DR (2016 IRP)
- Oregon passes 50% renewables by 2040 (SB1547)
 - Coal retired by 2030, TE, community solar
- Oregon passes Energy Storage Mandate (HB 2193)
 - At least 5 MWh up to 38.7 MW by 2020

Balancing challenges

2050 High Electricity Scenario to meet decarbonization goals

Renewable generation exceeds load in 46% of all hours in a typical year

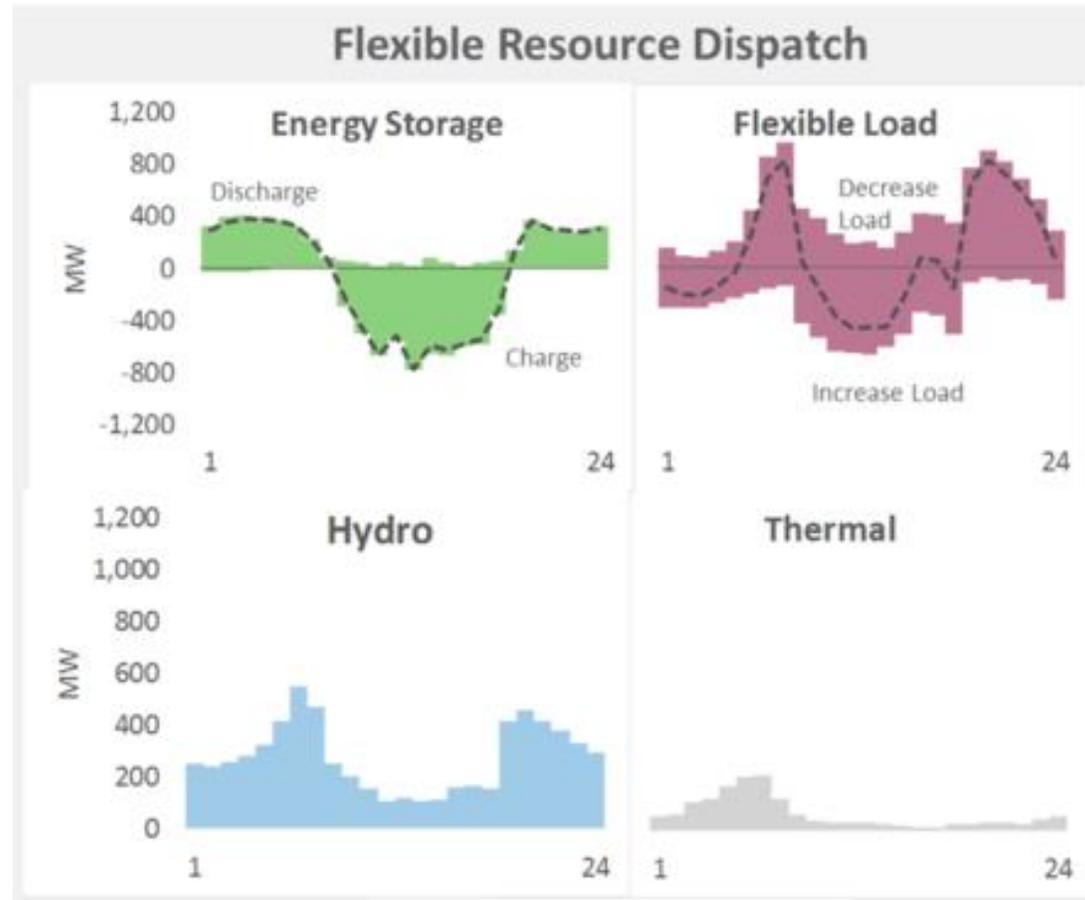

Excess generation in a single hour may be as high as 8,000 MW in a typical year

Source: PGE Decarbonization Study, Feb. 2018

Balancing solutions

In a deeply decarbonized future, flexibility in the electricity system is provided by both generators and loads

Vision & Goals DR/DER

Provide peak
Provide
peak
shaving,
storage and
grid stability

Meet ~6% of peak load by January 2021

- 77 MW DR, 38 MW of battery, 135 MW DSG

Pilot to full-scale flexible load and DER

Peak event DR evolves to “always on”
Flexible ecosystem current and future needs

Demand Response Context

- Coming out of 2016 IRP, PGE ordered to achieve a minimum of 77 MW in winter and 69 MW in summer of demand response
- PGE's context for acquiring DR is unique compared to many other utilities:
 - Dual peaks: winter and summer
 - Winter DR very rare across the country
 - Does not directly implement energy efficiency programs
 - Heavily residential/commercial service territory (most large industrial is direct access)
 - No wholesale market and relatively small vendor community
 - Immature market for DR
- Given this context, PGE sought to develop a portfolio of DR programs that leveraged smaller customers and capitalized on previous success in EE and renewables

Guiding Design Principles

Ensure that all customers have at least one program

- Provide a mix of firm, non-firm programs
- Minimize upfront costs and risks to participate

Don't ask customers to sacrifice

- Utilize loads with inherent storage (water heat, thermostats, process)
- Shift loads, don't shed

Pay customers for what they can control

- Incentives should relate to actions (eg customers control opt-outs, not the a kW draw from a t-stat)
- Customers shouldn't be punished for small variations in baseline calcs

Meet customer where they are

- Work with vendors customers already work with
- Don't require customers to use hardware/software/channels that don't fit their lifestyle

Don't leave value on the table

- Don't screen out resources just because they don't meet ideal operating characteristics (notification, duration, etc)
- Find ways to differentiate value between higher and lower quality resources

Guiding Design Principles

Consider customer lifecycle in offerings

- Give customers different levels of participation (where possible)
- Start with manual/price-based, but provide incentives to upgrade to auto

Keep an eye on future use cases

- Give preference to resources that have multiple use cases (DR + EE, DR + resilience, DR + ancillary services)
- Build for what you think your needs will be in 5-10 years, not today

Be wary of turnkey solutions

- Avoid vendor lock; diversify suppliers
- Where possible, keep software and hardware separate
- Prioritize open standards

Be thoughtful when allocating performance risk

- Be inclusive with vendors and carefully consider what performance risks each party can realistically be accountable for
- Wherever possible, terms of participation between customer and utility to mitigate vendor risk

A MW isn't just a MW

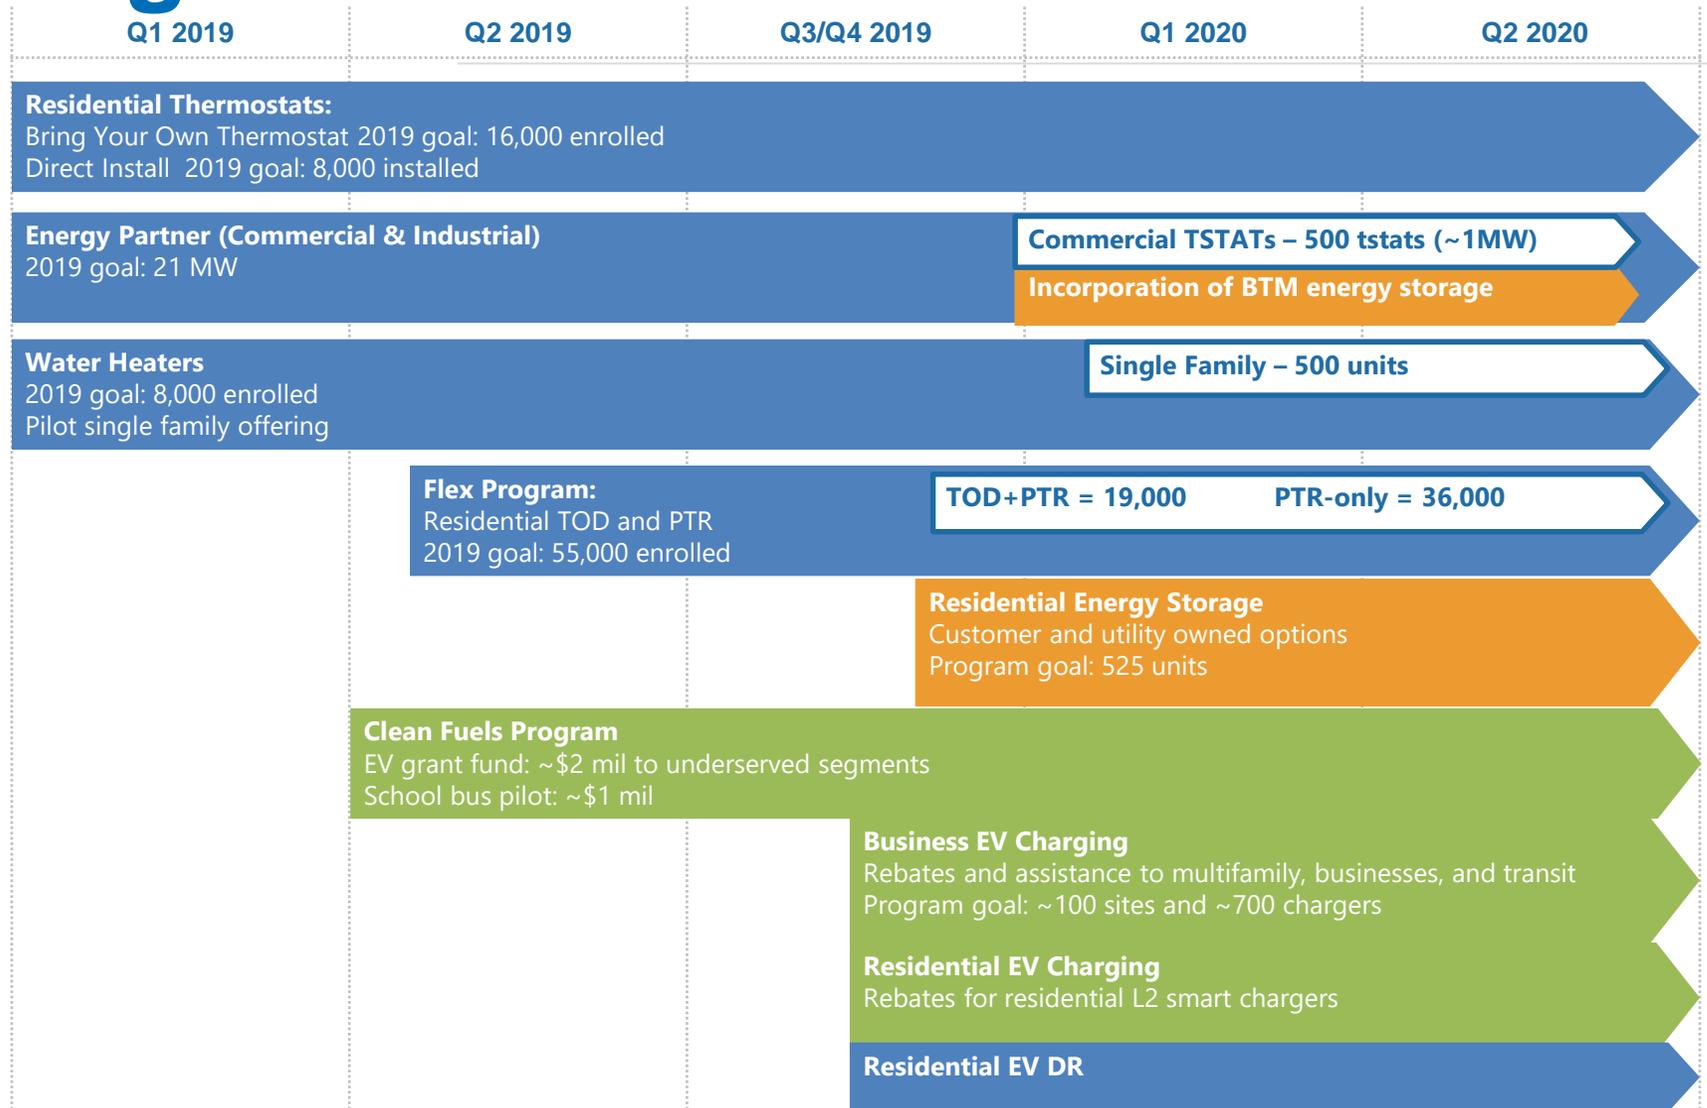

- It can be misleading to compare MWs of DR between utilities
- Idaho Power and PacifiCorp have large programs in irrigation and AC, but are summer only
- Utilities with large portfolios largely rely on DR 1.0
 - Example: Xcel has ~1,600 MW of DR, all but 20 is DR 1.0

Demand Response Evolution

2019 Program Plan

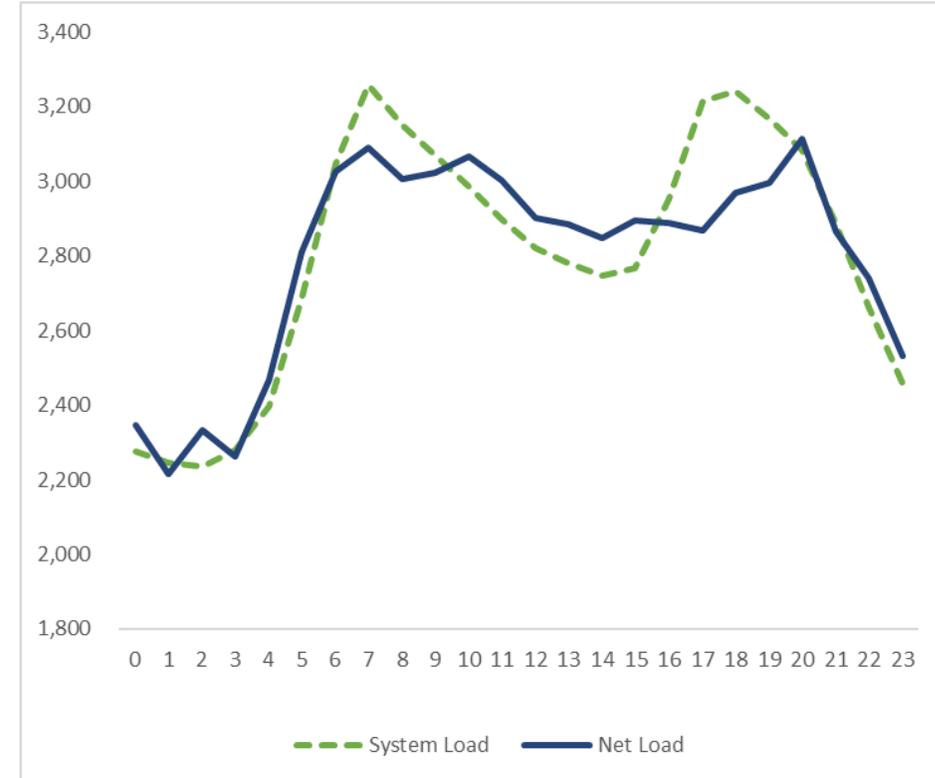

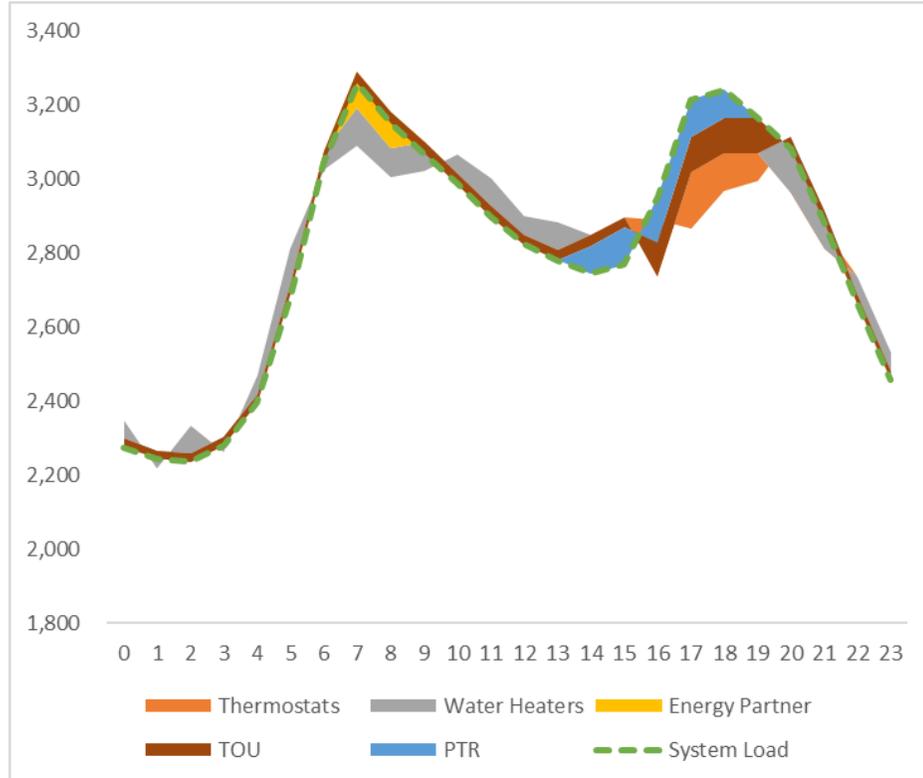

Distributed Flexibility

Energy Storage

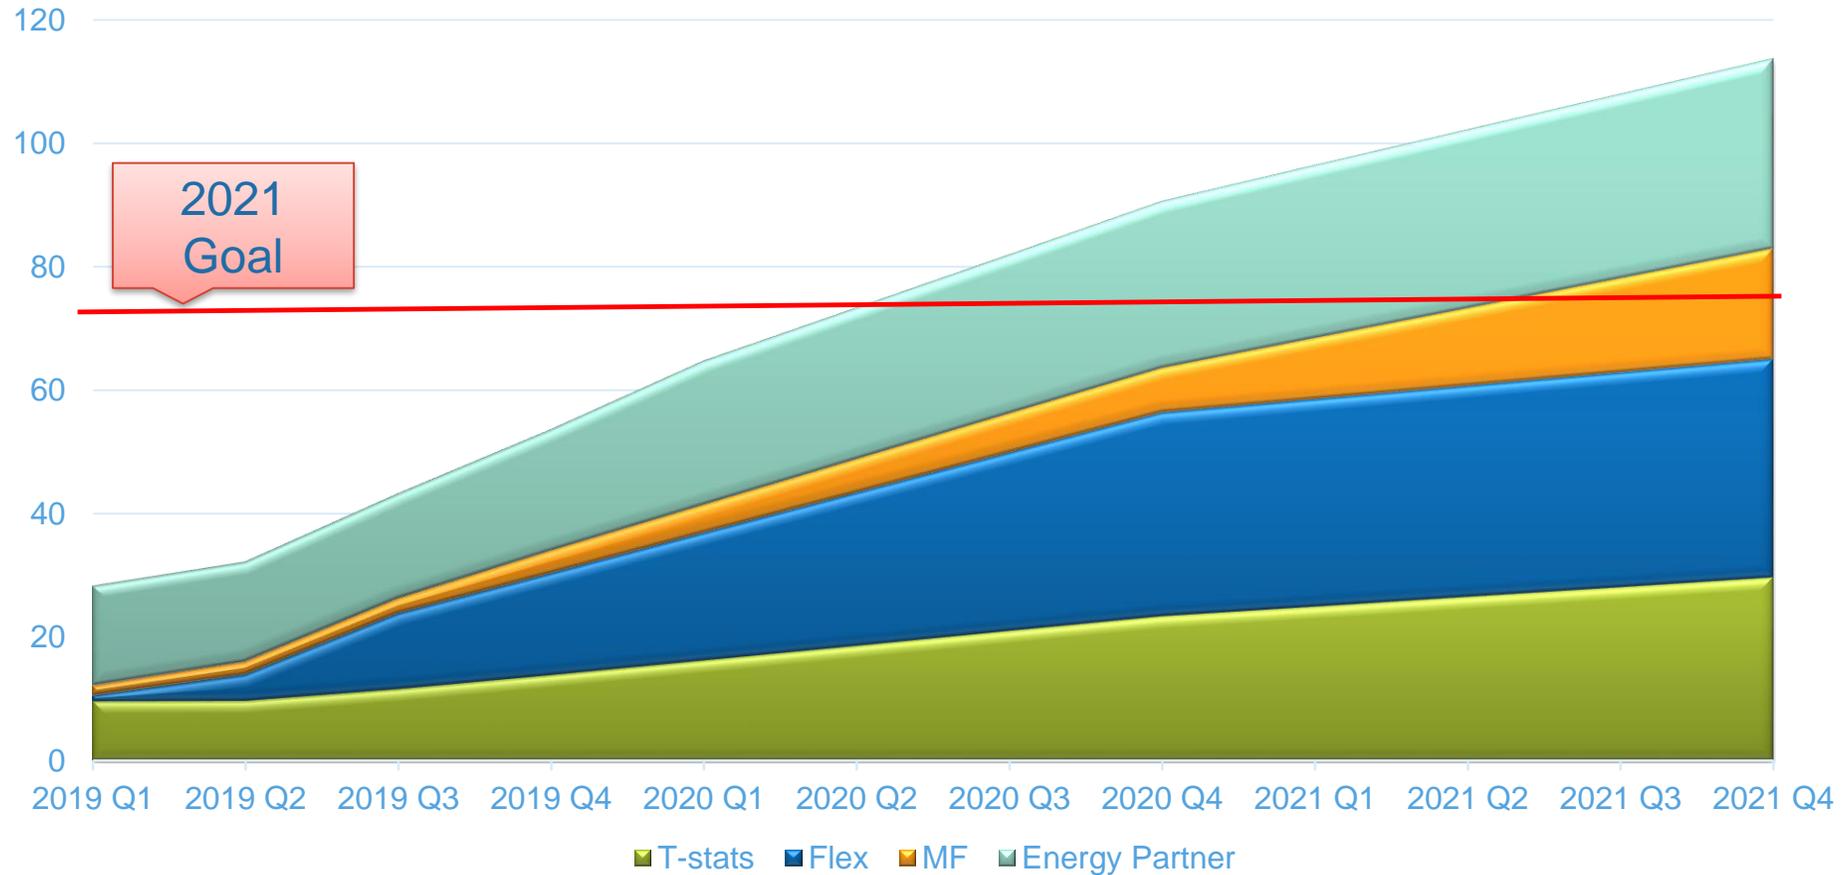

Transportation Electrification

Portfolio Dispatch of DR (illustrative)

DR Portfolio Forecast through 2021

Average Forecast MW Demand Response Forecast

Demand Response (DR)

Phase 1

Pilots and Programs to meet 2021 commitments

- C&I DR (21MW currently)
- BYOT (13.6MW currently)
- Res Thermostat Direct Install (2018), Ship & DIY Install (2019)
- Multi-Family Water Heaters (2018) (1.9MW), Market Transformation
- Flex Pricing (14.5MW currently)
- DSG (123MW currently)
- Smart Cities “umbrella”

Phase 2 Planning

Expand and grow / DR offering for every customer

- Investigate Business Pricing program
- Residential EV Charging
- DR Test Beds expand to DER

2021 Targets (MW)

C&I	27
Tstat	10
WH	4
Flex	38
DSG	135

Distributed Energy Resources (DER)

Phase 1

Grow renewables, expand flexible load & set-up storage

- Demand Response Programs (UM 1708/1514)
- Storage Proposal (UM1856)
- Transportation Electrification (UM1811)
- Smart Cities “umbrella”

Phase 2 Planning

Future development

- Implement DER Strategy (systems, markets)
- DR Test Bed
 - Phase 1 DR “at scale” – 3 substations
 - Phase 2 contemplated full DER at scale
 - DER programs and distribution use cases
